

2/10/24 - Exp Feature for Fitness App

Read/Write file - `open('filename.txt', 'r+')`

read & write

'a' - appends to end of file  
'w' - overwrites everything

`file.readlines()` - use to read specified lines (reads all lines into memory but can select by index)

for loops can iterate through open files as well instead of using `read()` `readlines()` to save memory in Python (read/readlines loads the entire file into memory!)

---

Wall Jump transfer to VSCode

- create a venv by clicking select interpreter at bottom of window and select python interpreter
- this will create a venv and the directory that allows pip installation of libraries & packages from the command line!
