

2/1/24

* Side note * - modified red editor in windows to open folder in VS Code - search stack overflow

passing args to html from Python via Flask/Jinja

```
@app.route('/')
def home-page():
    exercises = exercises()
    return render_template("index.html", exercises = exercises)
```

wrong
single quotes!!

* Consider SCOPE when passing data/variables to html through router functions

* Syntax for loops in html via jinja/flask : $\{ \% loop\ statement \% \}$
 $\lt li \gt \{ \% variable \% \} \lt /li \gt$
 $\{ \% endfor \% \}$

2/3/24 - Flask

* @app.route() - used for defining URL routes

* url_for() - used for generating URLs for those routes

for key in my-dict : } yields dict keys
print(key)

my-dict.keys() → yields a view object of keys
a reference/alias of keys for the dict keys

@app.route("/<workout>")
def get_lift(workout):
 return render... ~

these seem to need to match up or at least include each other
* make sure to pass "workout" to return values as well

* Ctrl + shift + V opens .md in VS Code
